

## Website Accessibility & Usability

Language: Change the `<html lang=en>` code so that a person can look and see what language the text in the website is written in.

Redundant title text: In my html I had title attribute value used to provide advisory information. The advisory information presented in my webpage was identical to the element text or alternative text. So, I fixed the problem by removing the title attribute which was not needed.

Alternative text: So, I changed my Alternative text for my picture to more clearly represent what the picture is so that if people can't see the photo that well they will still know what it is.

Unorder list: Changed my one unordered list to a bullet list so that it was more clearly shown as a list and made sure that the unordered was the right list to use then the order list.

Empty links and redundant links: So, for this problem the way the checker is programmed it doesn't like the `<center>` tag immediately after the `<a href="files/awards.html">`. This was the same after all my other links to, so I deleted the center tags out and used a `<div style: "text-align: center">` tag to realign it back to the center.
